## NP-217 SKIVING MACHINE FOR TUBULAR UPHOLSTERY HANDLES

This machine skives those portions of all kinds of bag and pouch handles that protrude during the production process of sewing machine operation. Originally, protruding portions were sheared off with a spatulate flat edge. This type of work requires extensive labor and skill so that this work has been considered to be difficult. The NIPPY handle skiver does not use a shearing or cutting method but a skiving method instead. As a result, it is not necessary to be an expert at all, and any beginner can work operate the machine easily. In addition, thread beveling is available in other production processes.

### ■ Specifications

Type	Machine dimensions (L×W×H)	Motor Capacity	Number of Revolutions per Minute	Weight
NP-217	250×470×146 mm	0.2-0.4 Kw	1,000 - 1,200 RPM	28 Kg

The design is subject to change without notice
